[^0]Examples Illustrating Use of Table 11.2, preceding page:

## Closed-Space Dimensions

All dimensions designated " $Y$ " are classed as "metal dimensions," and tolerances are determined from column 2.
Dimensions designated " $X$ " are classed as "space dimensions through an enclosed void," and the tolerances applicable are determined from column 4 unless 75 percent or more of the dimension is metal, in which case column 2 applies.

## Open-Space Dimensions

Tolerances applicable to dimensions " $X$ " are determined as follows:

1. Locate dimension " $X$ " in column 1.
2. Determine which of columns $4-9$ is applicable, dependent on distance "A."
3. Locate proper tolerance in column 4, 5, 6, 7, 8 or 9 in the same line as dimension " $X$."

Dimensions " $Y$ " are "metal dimensions"; tolerances are determined from column 2. Distances "C" are shown merely to indicate incorrect values for determining which of columns 4-9 apply.

Tolerances applicable to dimensions " $X$ " are determined as follows:

1. Locate distance " $B$ " in column 1.
2. Determine which of columns 4-9 is applicable, dependent on distance "A."
3. Locate proper tolerance in column 4, 5, 6, 7, 8 or 9 in the same line as value chosen in column 1.

Tolerances applicable to dimensions " $X$ " are not determined from Table 11.2; tolerances are determined by standard tolerances applicable to angles "A."

## Footnotes for Tables 11.2 Through 11.4:

(1) These Standard and Precision Tolerances are applicable to the average profile. The extrusion conditions required to produce the wide variety of alloy-temper and profile combinations require close review between customer and producer to determine critical characteristics and tolerance capability. Agressive profile characteristics may require wider than standard tolerance and closer than precision tolerance may be feasible for other characteristics.
(2) The tolerance applicable to a dimension composed of two or more component dimensions is the sum of the tolerances of the component dimensions if all of the component dimensions are indicated.
(3) When a dimension tolerance is specified other than as an equal bilateral tolerance, the value of the standard tolerance is that which applies to the mean of the maximum and minimum dimensions permissible under the tolerance for the dimension under consideration.
(4) Where dimensions specified are outside and inside, rather than wall thickness itself, the allowable deviation (eccentricity) given in Column 3 applies to mean wall thickness. (Mean wall thickness is the average of two wall thickness measurements taken at opposite sides of the void.)
(5) In the case of Class 1 Hollow Profiles the standard wall thickness tolerance for extruded round tube is applicable. (A Class 1 Hollow Profile is one whose void is round and one inch or more in diameter and whose weight is equally distributed on opposite sides of two or more equally spaced axes.)
(6) At points less than 0.250 inch from base of leg the tolerances in Col. 2 are applicable.
(7) Tolerances for extruded profiles in T3510, T4510, T6510, T73510,

T76510 and T8510 tempers shall be as agreed upon between purchaser and vendor at the time the contract or order is entered.
(8) The following tolerances apply where the space is completely enclosed (hollow profiles); For the width (A), the balance is the value shown in Col. 4 for the depth dimension (D). For the depth (D), the tolerance is the value shown in Col. 4 for the width dimension (A). In no

case is the tolerance for either width or depth less than the metal dimensions (Col. 2) at the corners. Example-Alloy 6061 hollow profile having $1 \times 3$ rectangular outside dimensions; width tolerance is $\pm 0.021$ inch and depth tolerance $\pm .034$ inch. (Tolerances at corners, Col. 2, metal dimensions, are $\pm 0.024$ inch for the width and $\pm 0.012$ inch for the depth.) Note that the Col. 4 tolerance of 0.021 inch must be adjusted to 0.024 inch so that it is not less than the Col. 2 tolerance.
" $X$ " and " $Z$ " of the example (right), even when " $Y$ " is 75 percent or more of " $X$." For the tolerance applicable to dimensions " $X$ " and "Z," use Col. 4, 5, 6, 7, 8 or 9, dependent on distance "A."

3t or Greater

(10) The wall thickness tolerance for hollow or semihollow profiles shall be as agreed upon between purchaser and vendor at the time the contract or order is entered when the nominal thickness of one wall is three times or greater than that of the opposite wall.
(11) For those $5 x x x$ alloys with a magnesium content of greater than or equal to $4.0 \%$ nominal, tolerances are $150 \%$ of those values shown in the standard tolerance columns.

| inch per inch of width | <br>

\hline $1 / 4$ <br>
$1 / 2$
\end{tabular}

(7) Applies only if the thickness along at least $1 / 3$ of the total perimeter is 0.094 or less. Otherwise use the tolerance shown for 0.095 and over.
(8) Tolerance for "O" temper material is four times the standard tolerances shown.
(9) Straightness must be met in all orientations, including orientations which are not self-supporting.

## Footnotes for Tables 11.9 through 11.14

(1) These Standard Tolerances are applicable to the average profile; wider tolerances may be required for some profiles, and closer tolerances may be possible for others.
(2) Conditions include die lines and handling marks.
(3) As measured with a contour gauge whose surface is limited to a maximum subtended angle of 90 degrees. Extruded curved surfaces comprising more than a 90 -degree subtended angle are checked by sliding the gauge across the surface, thus checking two or more 90 -degree portions of the surface. Extruded profile surfaces comprising arcs formed by two or more radii require the use of a separate contour gauge for each portion of the surface formed by an individual radius. (4) Tolerances for T3510, T4510, T6510, T73510, T76510 and T8510 tempers shall be as agreed upon between the purchaser and vendor and at the time the contract or order is entered.
(5) Angles are measured with protractors or with gauges. As illustrated, a four-point contact system is used, two contact points being as close to the angle vertex as practical, and the others near the ends of the respective surfaces forming the angle. Between these points of measurement surface flatness is the controlling toler-
 ance.
(6) When the area between the surface forming an angle is all metal, values in column 2 apply if the larger surface length to metal thickness ratio is 1 or less. (7) When two legs are involved the one having the larger ratio determines the applicable column.
(8) Not applicable to 2219 alloy extrusions. Most profiles in 2219 alloy will have die lines about twice the depth shown in the table; however, for each profile the supplier should be contacted for the roughness value to apply.
(9) If unspecified, the radius shall be $1 / 32$ in. maximum including tolerances.
(10) Tolerance for "O" temper material is four times the standard tolerances shown.

[^0]:    Footnotes for Table 11.2 are found on page 5.
